

Biden Hits the Ground Running on COVID-19, But Faces Daunting Challenges

A slow vaccine rollout and the emergence of new coronavirus mutations threaten progress in reducing new cases and death.

January 28, 2021 By [Liz Highleyman](#)

A week after his inauguration, President Joe Biden has hit the ground running in response to the COVID-19 pandemic, but the new administration faces formidable challenges, including an inadequate supply of vaccines and emerging coronavirus variants that could render them less effective.

“A once-in-a-century virus silently stalks the country. It’s taken as many lives in one year as America lost in all of World War II,” Biden said in his January 20 [inaugural address](#). “We are entering what may well be the toughest and deadliest period of the virus. We must set aside the politics and finally face this pandemic as one nation.”

First, the good news: COVID-19 cases are falling nationwide. At a [White House press briefing](#) this week, Centers for Disease Control and Prevention (CDC) director Rochelle Walensky, MD, said that new cases declined by 21% over the past week. The death rate remains high—the administration warned that as many as 90,000 more people could die by the end of February—but declines in hospitalizations and deaths typically trail falling cases by a couple of weeks.

Executive Orders

On his first day in office, Biden signed a set of executive orders, many of them reversing policies implemented by Donald Trump, and he [cancelled the pending withdrawal](#) of the United States from the World Health Organization (WHO).

Yesterday, President Biden reversed the United States’ withdrawal from the World Health Organization. And this

morning, Dr. Fauci joined his first meeting as the head of our delegation. Here's what he said:

pic.twitter.com/yvv2ojcfXh

— The White House (@WhiteHouse) [January 22, 2021](#)

The following day, Biden's chief medical adviser Anthony Fauci, MD, director of the National Institute of Allergy and Infectious Diseases, [told the WHO executive board](#), "[T]he United States stands ready to work in partnership and solidarity to support the international COVID-19 response, mitigate its impact on the world, strengthen our institutions, advance epidemic preparedness for the future, and improve the health and well-being of all people throughout the world." Fauci also indicated that the United States would participate in the [COVAX initiative](#), a global effort to provide COVID-19 treatments and vaccines in low-income countries.

The same day, Fauci [told reporters](#) at the administration's first White House press briefing that it was a "liberating feeling" to be able to discuss COVID-19 without fear of repercussions from Trump.

Biden has challenged all Americans to wear face masks during his first 100 days in office in an effort to curb the spread of COVID-19. But in some settings, this will not be optional. [One new executive order](#) requires on-duty federal employees and other individuals in federal buildings and on federal lands to wear masks, while [another order](#) mandates masks in airports and on planes, trains and intercity buses. Broader mask mandates fall under the purview of state governors. International travelers will be required to provide proof of a recent negative coronavirus test and comply with CDC self-quarantine guidelines.

A week later, Biden [signed an order](#) to open a special enrollment period for the Affordable Care Act (February 15 through May 15), giving people who lost employer-based health insurance another chance to participate in the federal program.

Comprehensive COVID-19 Plan

On his second day in office, the Biden administration released a new COVID-19 strategy, expanding on [the plan offered in late November](#).

We are building a partnership with the American people to confront COVID-19.

A partnership rooted in transparency and science.

And together, we will mount an effective response to the pandemic that gets us all back to our lives and

loved ones: <https://t.co/msJ4ut25L3>

— White House COVID-19 Response Team

(@WHCOVIDResponse) [January 21, 2021](#)

The [198-page document](#) includes the following seven overarching goals:

- Restoring trust with the American people.
- Mounting a safe, effective, comprehensive vaccination campaign.
- Mitigating coronavirus spread through expanded masking, testing, treatment, data, workforce and clear public health standards.
- Expanding emergency relief and exercising the Defense Production Act.
- Safely reopening schools, businesses and travel, while protecting workers.
- Protecting those most at risk and advancing equity, including across racial, ethnic and rural/urban lines.
- Restoring U.S. leadership globally and building better preparedness for future threats.

The effort to restore trust includes regular public briefings on COVID-19 led by scientific experts and clear, evidence-based public health guidance, both for individuals about personal precautions and for communities around issues such as stay-at-home orders and school closures. What's more the plan will provide emergency funding for state and local governments, schools and small businesses to help them comply with such recommendations.

Biden has set a goal of 100 million vaccine doses to be given during his first 100 days in office. His [vaccination plan](#) calls for community vaccination centers supported by the Federal Emergency Management Agency and the National Guard, mobile vaccination clinics to reach underserved urban and rural populations, and expanded partnerships with pharmacies and Federally Qualified Health Centers.

Efforts to accomplish the third goal include ensuring wider access to free COVID-19 testing by doubling the number of drive-through test sites, investing in at-home and rapid tests and creating a new public health jobs corps to carry out contact tracing and other tasks. In addition, Biden has asked the Occupational Safety and Health Administration to come up with [stronger guidelines to protect workers](#).

The plan aims to protect older individuals and others at risk and to ensure they have equitable access to testing, vaccines and funding. To that end, Biden has established a [COVID-19 Health Equity Taskforce](#), to be headed by [Marcella Nunez-Smith, MD, MHS](#), of Yale University.

To implement the strategy, Biden has proposed a \$1.9 trillion pandemic relief package, which includes direct stimulus payments to individuals, but it faces stiff opposition from Republicans—and a few Democrats—in the Congress.

Slow Vaccine Rollout

The COVID-19 vaccine rollout has proceeded more slowly than initially projected by the director of Operation Warp Speed, the Trump administration's vaccine development program. As of January 28, just over 27 million doses have been administered, according to [Bloomberg's vaccine tracker](#).

So far two vaccines, from [Pfizer/BioNTech](#) and [Moderna](#), have been authorized by the Food and Drug Administration. Both vaccines require two doses, ideally given three or four weeks apart. In clinical trials, these vaccines were, respectively, 95% and 94% effective. The Pfizer/BioNTech vaccine has also demonstrated real-world effectiveness in Israel, reducing infections by 92%, [according to the Times of Israel](#).

But health officials had hoped that, by this time, more vaccines would be available to augment the total supply.

Already approved in the United Kingdom and several other countries, a vaccine from AstraZeneca and the University of Oxford is still in a Phase III study in the United States, after [unexplained results](#) were reported in other late-stage trials. Janssen, the only company developing a single-shot vaccine, is [expected to announce Phase III trial results](#) any day now. A vaccine from Novavax is also in the final stages of testing. The company [announced this week](#) that it was 89% in a U.K. trial, approaching the effectiveness of the Pfizer/BioNTech and Moderna vaccines.

Administration officials said they found the existing vaccine distribution effort in disarray, forcing them to essentially start from scratch. “[T]he vaccine program is in worse shape than we anticipated or expected,”

[Biden said this week](#). As previously reported, there is [no remaining federal stockpile of vaccines](#), and doses are being distributed to states right off the production line.

Emerging Mutations

Speeding up the vaccine rollout is especially urgent given the emergence of new, more transmissible SARS-CoV-2 variants. These new strains have various mutations in the spike protein that the coronavirus uses to enter human cells.

A variant first identified in the United Kingdom in December, [dubbed B.1.1.7](#), is thought to be up to 70% more transmissible. That strain was soon reported in the United States and dozens of other countries. A mutation identified in South Africa, [named 501Y.V2 or B.1.351](#), which is also more transmissible, was detected in the United States for the first time last week, with two cases [reported in South Carolina](#). And a new strain first identified in Brazil has now been [found in Minnesota](#).

Those Covid-19 variants? ‘Don’t worry yet,’ vaccine expert says <https://t.co/s4bqVGsFvg> — STAT (@statnews) [January 28, 2021](#)

Researchers are scrambling to test various vaccines against the new variants. So far, the [Pfizer/BioNTech](#) and [Moderna](#) vaccines appear to work against the U.K. variant, but they appear to be slightly less effective against the South African strain. However, Novavax said its vaccine candidate was [only 49% effective](#) in a trial in South Africa, where some 90% of people have the new variant.

Fortunately, modern vaccine platforms that deliver genetic instructions for making viral proteins—or the proteins themselves—can be quickly modified to target new variants. Vaccine manufacturers are now [rushing to develop broader-spectrum vaccines](#), as well as booster shots for those already vaccinated.

But it’s a race against time, because the longer SARS-CoV-2 is able to circulate in unprotected populations, the greater the odds that new perhaps more resistant mutations will evolve.

The new administration is working hard to increase the vaccine supply. Biden [announced this week](#) that his team is in negotiations to purchase 100 million additional doses each of the Pfizer/BioNTech and Moderna vaccines, enough to fully vaccinate 300 Americans by the end of the summer or the beginning of the fall. He will also take extraordinary measures to increase production of syringes, personal protective equipment and other supplies.

“This is a wartime undertaking; it’s not hyperbole,” Biden said. “[W]e’re using the Defense Production Act to launch a full-scale, wartime effort to address the supply shortages we inherited from the previous administration.”

Nice [@NewYorker](#) piece by [@DhruvKhullar](#) on where we are as Biden & team try to turn Covid battleship around. So far: gr8 people & communication, & comprehensive plan. But that's the easy part - big question is: can they pull off a cultural & political reset
