

# HCV Current Initiative: Addressing the National Epidemics of Prescription Opioid misuse and Hepatitis C through Unique Partnerships

Discusses the hepatitis C and prescription opioid misuse epidemics in the U.S. and provides resources for health professionals

October 7, 2015 By Dominique Saunders and Sarah Knopf-Amelung

---

Recently, there has been a spotlight on America's prescription opioid misuse and overdose epidemics. However, too often, people remain unaware of the related hepatitis C virus (HCV) epidemic. The Centers for Disease Control and Prevention (CDC) reported an estimated 150% increase in new HCV infections from 2010 to 2013 and, further, that most of the new infections were associated with injection drug use. An analysis of state and national data indicate that a large proportion of new HCV infections are occurring in young people (<30 years of age) in rural and suburban areas who use oral prescription opioid analgesics before transitioning to injecting

At the same time, recent years have seen advances that have revolutionized the field of hepatitis C. Groundbreaking treatments with cure rates as high as 90-100% are now available. Preventive screenings without cost-sharing under the Affordable Care Act make HCV screening more accessible for many people. And the national [Viral Hepatitis Action Plan](#) increases coordination across federal programs and includes among its priorities the urgent need to reduce viral hepatitis associated with drug use behaviors.

However, reaching health professionals with information about these important changes in the evolving hepatitis C arena can be challenging. Because of the prevalence of HCV among people who inject drugs, addiction treatment and recovery professionals are a key group to engage in efforts to address HCV. Additionally, both primary care and behavioral health settings are becoming increasingly important providers of HCV screening and care, creating the need for more effective means for timely HCV information dissemination.

Launched in 1993, the [Addiction Technology Transfer Center](#) (ATTC) network is a Substance Abuse and Mental Health Services Administration (SAMHSA)-funded, nationwide resource for professionals in the addictions treatment and recovery services fields. In 2011, SAMHSA tasked the ATTC Regional Centers with developing a national HCV educational initiative targeting behavioral health and medical providers. Since over half of new HCV infections are associated with injection drug use, the ATTCs were uniquely positioned to address the hepatitis C epidemic through existing expertise and connections with the behavioral health workforce. The timing was perfect to bridge the gap in the behavioral health workforce's knowledge about HCV as well as provide cross-training in behavioral health for medical providers.

As a result, the [HCV Current](#) initiative was launched in March 2015. HCV Current provides free HCV informational resources for health professionals, including [online](#) and [in-person](#) curriculum and training, downloadable [provider tools](#), and [region-specific resources](#). As new HCV research emerges, these products are updated. The tools available on *HCV Current* can help empower health care professionals to better educate patients about what to expect along each stage of the HCV continuum of care, including screening and understanding treatment options. Providers can also download patient education resources, including fact sheets.

### **Engaging Regional Experts**

To augment the *HCV Current* initiative, one [ATTC Regional Center](#) took a novel approach to enhance the effort by engaging regional expertise. The [Mid-America ATTC](#) (which serves HHS Region 7) formed an HCV Stakeholder Group of experts from Iowa, Kansas, Missouri, and Nebraska. Composed of CDC-funded [Viral Hepatitis Prevention Coordinators](#) from those states and other stakeholders, the group provided expertise in the development of a free, 1.5-hour self-paced online course, [HCV Snapshot: An Introduction to Hepatitis C for Health Care Professionals](#). Continuing education for this course is available for nurses, social workers, addiction professionals, Certified Health Education Specialists, and others. The HCV Stakeholder Group members also serve as regional trainers on behalf of Mid-America ATTC and welcome additional collaborations. Stakeholders provide 3- and 6-hour trainings in their respective jurisdictions for free in collaboration with Mid-America ATTC.

### **Strategic Partnerships for Integrated Care**

The partnership between the Viral Hepatitis Prevention Coordinators and the Mid-America ATTC supports collaboration and integration between behavioral health and medical providers. The *HCV Current* initiative illustrates important progress in community stakeholder efforts toward achieving the goals of the national Viral Hepatitis Action Plan. The Initiative creates new partnerships to leverage existing resources, increases provider and system capacity to deliver HCV services, and builds momentum in our national response to this now-curable infectious disease. Viral Hepatitis Prevention Coordinators are key resources within their states and those involved in the Initiative have already experienced a shift in improved provider perceptions, engagement, and knowledge. This is an exciting time both nationally and locally, as we develop better tools and resources to empower providers in every community and improve the quality of lives in our communities by preventing and curing HCV.

To locate training opportunities near you, check the *HCV Current's* [Training and Events calendar](#)

*Dominique Saunders is Viral Hepatitis Prevention Coordinator, Kansas Department of Health and Environment; Sarah Knopf-Amelung is Project Manager, Mid-America ATTC, University of Missouri-Kansas City School of Nursing and Health Studies. This article was originally published on [AIDS.gov](#).*
